BUSINESS REQUIREMENTS DOCUMENT (BRD)

Project Name: Sprintly

Document Version: 1.1

Date: 02/03/2026

Prepared By: Team Blitzkrieg

1. Introduction

1.1 Purpose of the Document

This document defines the business requirements for the project Sprintly, a Kanban-based project and task management web application. It outlines the business problem, objectives, proposed high-level solution, and success metrics.

1.2 Scope of the Project

Sprintly is intended to provide a structured, role-based task management platform for small teams, academic groups, and hierarchical project environments.

1.3 Stakeholders

- Project Development Team – Responsible for design and implementation.
- Academic Supervisor – Provides evaluation and guidance.

- Students and Small Teams – Primary end users of the system.
- Viewers (e.g., higher management & team leads) – Secondary users who monitor project progress.

2. Business Problem

Small academic teams and startup groups often manage tasks using informal tools such as messaging platforms, spreadsheets, or verbal coordination. This approach creates several operational challenges:

- Lack of clearly defined task ownership
- Limited visibility into project progress
- Difficulty tracking deadlines
- No structured workflow management
- Minimal transparency for higher management

Existing enterprise tools such as Jira are often too complex for small teams, while tools like Trello may not enforce strict role-based task control required in structured environments.

As a result, there is a need for a lightweight, controlled, and role-driven Kanban-based task management system.

3. Business Objectives

The primary objectives of Sprintly are:

3.1 Improve Task Visibility

Provide a visual Kanban board that displays tasks across workflow stages (To Do, In Progress, Done**).**

3.2 Enforce Role-Based Control

Implement three clearly defined roles:

- Owner
  - Create projects
  - Create and assign tasks
  - Move any task
  - Manage participants
- Participant
  - Move only their assigned tasks
  - Comment on other tasks
- Viewer
  - View project progress and task status
  - No modification permissions

3.3 Improve Accountability

Ensure every task is assigned to a specific participant.

3.4 Enhance Management Transparency

Allow Viewers (e.g., faculty or higher management) to monitor project progress without operational interference.

4. Proposed Solution (High-Level)

Sprintly will be developed as a web-based Kanban-style application with the following high-level components:

4.1 System Overview

Sprintly will be developed as a web-based Kanban-style application accessible through modern web browsers. The system will provide:

- A web interface for user interaction
- Secure user authentication and role-based access control
- Persistent storage for projects, tasks, and user data

The solution is designed to be lightweight, structured, and suitable for small teams and academic environments.

4.2 Core Functional Features

4.2.1 User and Role Management

- Secure login and authentication
- Role assignment (Owner, Participant, Viewer)
- Role-based access control enforcement

4.2.2 Project Management

- Owner creates projects

- Owner invites Participants and Viewers
- Dashboard view for project overview

4.2.3 Kanban Board

- Default workflow columns:
  - To Do
  - In Progress
  - Done
- Drag-and-drop task movement
- Automatic status update on movement

4.2.4 Task Management

Each task will include:

- Title
- Description
- Assigned participant
- Priority level (e.g., Low, Medium, High)
- Due date
- Status

The priority level will assist teams in identifying task importance but will not automatically enforce execution order.

4.2.5 Progress Monitoring

- Task count by status

- Completion percentage
- Identification of overdue tasks

5. Success Metrics

The success of Sprintly will be evaluated based on the following measurable criteria:

5.1 Functional Success

- Complete implementation of role-based access control
- Successful project creation and task assignment
- Accurate enforcement of task movement restrictions

5.2 Performance Metrics

- Page load time shall not exceed 3 seconds under normal usage conditions.
- Drag-and-drop task movement shall function without noticeable interface freezing under normal load.
- The system shall support at least 30–50 concurrent active users within shared hosting constraints.

5.3 User Adoption Metrics

- All team members actively use the system for task updates
- Reduced ambiguity in task ownership
- Clear visibility of project progress for Viewers

6. Assumptions

- Users will have stable internet access and modern web browsers.
- The system is intended for small to medium-sized teams (up to 50 active users).
- The hosting environment will remain operational during intended usage periods.
- Security requirements are appropriate for academic or internal team usage, not enterprise-grade deployment.

7. Constraints

- Project development timeline is limited to 20 days.
- The system will be delivered as a web application only.
- Advanced analytics and AI features are out of scope.
